

# Assignment 1

---

1. What are the differences between program and software?

Program is the executable form of the codes, while software is the combination of both program, data structures and documentation.

2. Why do we say:“The sooner you start writing a program, the longer it will take you to get done.”

Because there are many things to consider before getting hands on coding. We should have a clear idea of the requirement and specification of our software, decide how we can develop it and make a good plan. if we start early on programming, we may find the work unsatisfactory and unfit to what customers need, and it may be hard to turn back to the start point.
